

LinkedIn Job Notifier

Complete Beginner's Setup Guide

Data Engineer · Software Engineer · Any Role
Bengaluru · Hyderabad · Any City

Time to complete setup: ~10 minutes

What this tool does for you

■ Monitors LinkedIn every 15 minutes automatically

■ Sends desktop popup the moment a new job appears

■ Filters only your target roles and cities	■ Blocks senior / lead / manager jobs automatically
■ Shows a dashboard to track all jobs found	■ One click to open any job and apply on LinkedIn

TABLE OF CONTENTS

Step	Title	What you'll do
1	Download the Files	Organize your project folder
2	Install Python	One-time setup on your PC
3	Create Your .env Config File	Set your job role, city, experience
4	Install Required Libraries	Python packages the script needs
5	Run the Job Notifier	Start monitoring LinkedIn
6	Open the Dashboard	View all found jobs in browser
7	Apply for Jobs	One-click apply workflow
8	Your Daily Routine	How to use this every day
9	Change Your Settings	Update role, city, filters anytime
—	Common Problems & Fixes	Troubleshooting guide

1

Download the Files

Organize your project folder

You should have received 5 files from the setup. Download all of them and place them inside a single folder on your PC.

Create this folder:

```
C:\Users\YourName\Job Tracker\
```

Your folder should look exactly like this:

```
Job Tracker\  
■■■ job_notifier.py      ← the main script  
■■■ dashboard.html      ← job tracking website  
■■■ requirements.txt     ← list of libraries needed  
■■■ .env.example         ← config template  
■■■ README.md           ← documentation
```

■ IMPORTANT

All 5 files must be in the SAME folder. The script looks for its config files in the same directory it runs from.

2

Install Python

One-time setup — skip if already installed

First check if Python is already on your PC. Open Command Prompt and type:

```
python --version
```

What you see	What it means	Action
Python 3.11.0 (or any version)	Python is installed ✓	Skip to Step 3
'python' is not recognized...	Python is not installed	Follow steps below

If Python is NOT installed:

1. Go to python.org/downloads in your browser
2. Click the big yellow Download Python button
3. Run the downloaded installer file
4. CHECK ☐ the box "Add Python to PATH" before clicking Install
5. Click Install Now and wait for it to finish
6. Close CMD, reopen it, and run `python --version` to confirm

⚠ WARNING

The "Add Python to PATH" checkbox is CRITICAL. If you miss it, Python commands won't work in CMD. If you already installed without checking it, uninstall and reinstall Python.

3

Create Your .env Config File

Tell the script what jobs to find

The .env file is where YOU control everything — job role, city, experience level. You never need to touch the Python code.

Open CMD and navigate to your Job Tracker folder:

```
cd "C:\Users\YourName\Job Tracker"
```

Make a copy of the template and name it .env:

```
copy .env.example .env
```

Open the .env file in Notepad:

```
notepad .env
```

Settings you can change inside .env:

Setting	What it does	Example values
JOB_KEYWORDS	Which job titles to search	Data Engineer, Software Engineer
JOB_LOCATIONS	Which cities to search (use between cities)	Bengaluru, India Hyderabad, India
EXPERIENCE_LEVEL	Your experience bracket	entry (0-1.5yr) / associate / mid_senior
EASY_APPLY_ONLY	Only show Easy Apply jobs?	true / false
CHECK_INTERVAL	Minutes between each check	15 (don't go below 10)
TITLE_INCLUDE	Title must contain one of these	data engineer, software engineer
TITLE_EXCLUDE	Block jobs with these words in title	senior, lead, manager, director

■ NOTE

After editing, press Ctrl+S to save, then close Notepad. The .env file must stay in the same folder as job_notifier.py

4

Install Required Libraries

Python packages the script depends on — done only once

These are extra Python tools the script uses. You install them once and never again.

In CMD (make sure you're in Job Tracker folder):

```
cd "C:\Users\YourName\Job Tracker"  
pip install -r requirements.txt
```

You'll see a lot of text scrolling. That's normal — it's downloading. Wait for it to finish. It should end with:

```
Successfully installed requests-2.31.0 beautifulsoup4-4.12.0 ...
```

■ NOTE

If pip doesn't work, try: `python -m pip install -r requirements.txt`

What gets installed:

Library	What it does
<code>requests</code>	Connects to LinkedIn and downloads job listing pages
<code>beautifulsoup4</code>	Reads and extracts job details from the downloaded pages
<code>plyer</code>	Shows desktop popup notifications on Windows/Mac/Linux
<code>schedule</code>	Runs the check automatically every 15 minutes
<code>python-dotenv</code>	Reads your settings from the <code>.env</code> file

5

Run the Job Notifier

Start monitoring LinkedIn for new jobs

Make sure you are inside the Job Tracker folder in CMD:

```
cd "C:\Users\YourName\Job Tracker"  
python job_notifier.py
```

You should see output like this:

```
=====
LinkedIn Job Notifier
Roles      : Data Engineer, Software Engineer
Locations  : Bengaluru, India, Hyderabad, India
Experience : entry
Easy Apply : True
Interval   : every 15 min
Including   : ['data engineer', 'software engineer']
Excluding  : ['senior', 'lead', 'manager', ...]
=====
Checking for new jobs...
  Searching: 'Data Engineer' in Bengaluru, India
  -> 14 raw results
  Searching: 'Software Engineer' in Hyderabad, India
  -> 11 raw results
  Filter: 8 kept, 17 removed
NEW: 5 job(s) found!
  + Data Engineer @ Flipkart (Bengaluru, India)
  + Software Engineer @ TCS (Hyderabad, India)
Scheduler running. Ctrl+C to stop.
```

■ IMPORTANT

A desktop popup will appear in the bottom-right of your screen for each new job found. Do NOT close this CMD window — just minimize it!

What the output means:

- raw results = total jobs found on LinkedIn before your title filter
- kept = jobs that passed your TITLE_INCLUDE and TITLE_EXCLUDE filters
- removed = jobs blocked because they had 'senior', 'lead' etc in the title
- NEW = jobs not seen in previous checks (true new postings)

6

Open the Dashboard

View all found jobs in your browser

Open a SECOND CMD window — keep the first one running the notifier.

■ NOTE

How to open a second CMD: Press the Windows key → type CMD → press Enter. This opens a brand new CMD window.

In the second CMD window, type:

```
cd "C:\Users\YourName\Job Tracker"  
python -m http.server 8000
```

Now open Chrome or Edge and go to this address:

```
http://localhost:8000/dashboard.html
```

■ NOTE

Why do we need this second CMD? When you double-click dashboard.html, the browser can't read jobs.json for security reasons. Running a local server fixes this.

What you'll see on the dashboard:

Element	What it shows
Stats bar at top	Total jobs found, new today, applied count, pending count
Job cards	Each job found — title, company, location, time posted
Apply on LinkedIn button	Opens the job directly on LinkedIn in a new tab
Mark Applied button	Tracks that you have applied so it moves to Applied tab
Open All Pending button	Opens ALL unapplied jobs in separate tabs at once
Filter buttons	Switch between All / Pending / Applied views
Search box	Filter jobs by title, company name or location

✓ TIP

The dashboard auto-refreshes every 60 seconds. New jobs appear automatically — you don't need to press Refresh manually.

7

Apply for Jobs

Your one-click apply workflow

Once jobs appear on the dashboard, here is exactly how to apply:

1

Get notified

A desktop popup appears bottom-right when a new job is found

2

Open dashboard

Switch to your browser — <http://localhost:8000/dashboard.html>

3

See the job

New jobs appear at the top with a 'NEW' badge

4

Click Apply

Click 'Apply on LinkedIn →' — opens the job page in a new tab

5

Easy Apply

On LinkedIn, click the blue Easy Apply button and submit

6

Mark as Applied

Back on dashboard, click 'Mark Applied' to track it

✓ TIP

Pro Tip: Use 'Open All Pending' to blast all unapplied jobs open in tabs at once. Then go through each tab and Easy Apply. This is the fastest way.

8

Your Daily Routine

Do this every day — takes 2 minutes to start

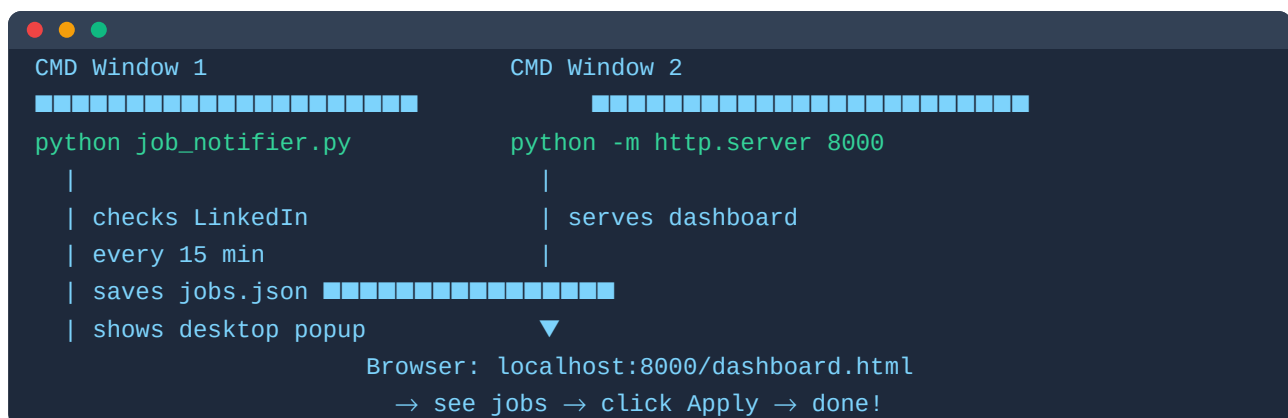

Every day when you sit down to job hunt, do exactly this:

CMD Window	Command to run	Purpose
Window 1	<code>python job_notifier.py</code>	Monitors LinkedIn, sends notifications, saves jobs
Window 2	<code>python -m http.server 8000</code>	Serves the dashboard so browser can read jobs
Browser	<code>http://localhost:8000/dashboard.html</code>	View jobs, click Apply, mark as applied

When you're done for the day:

- Press Ctrl+C in CMD Window 1 to stop the notifier
- Press Ctrl+C in CMD Window 2 to stop the dashboard server
- Close both CMD windows

Your full workflow visualized:

9

Change Your Settings Anytime

Update role, city, experience — no code needed

Want different jobs? Different city? Just edit `.env` — you never touch the Python code.

```
# Open .env in Notepad
notepad .env

# Make your changes, save with Ctrl+S

# Then restart the notifier (Ctrl+C first, then run again)
python job_notifier.py
```

Examples for different people:

Scenario: Fresher looking for Data Analyst jobs in Mumbai

```
JOB_KEYWORDS=Data Analyst,Business Analyst
JOB_LOCATIONS=Mumbai, India|Pune, India
EXPERIENCE_LEVEL=entry
TITLE_INCLUDE=data analyst,business analyst
TITLE_EXCLUDE=senior,lead,manager
```

Scenario: 3-year exp dev looking for backend roles

```
JOB_KEYWORDS=Backend Engineer,Python Developer
JOB_LOCATIONS=Bengaluru, India
EXPERIENCE_LEVEL=associate
TITLE_INCLUDE=backend engineer,python developer
TITLE_EXCLUDE=senior,director,vp
```

Scenario: Someone looking for remote jobs internationally

```
JOB_KEYWORDS=Data Engineer,ML Engineer
JOB_LOCATIONS=Remote|Singapore|Dubai
EXPERIENCE_LEVEL=entry
EASY_APPLY_ONLY=false
TITLE_EXCLUDE=senior,lead,principal
```

10

Share on GitHub (Optional)

Make your tool available for others to use

If you want to share this tool publicly so others can use it too:

Step 1. Create account — Go to github.com and sign up for free

Step 2. Install Git — Download from git-scm.com and install with default settings

Step 3. Create .gitignore — Stop private files from being uploaded publicly

Step 4. Create repo — On GitHub click New → name it 'linkedin-job-notifier' → Public

Step 5. Push code — Run git commands to upload your files

Create a .gitignore file to protect your private data:

```
# Never upload these files to GitHub
.env
jobs.json
seen_jobs.json
notifier.log
__pycache__/
*.pyc
```

Git commands to push to GitHub:

```
git init
git add .
git commit -m "Initial commit - LinkedIn Job Notifier"
git branch -M main
git remote add origin https://github.com/YOUR_USERNAME/linkedin-job-notifier.git
git push -u origin main
```

✓ **TIP**

Others who download your repo only need to: copy `.env.example` to `.env`, fill in their own settings, and run `python job_notifier.py`. They never touch your code!

Common Problems & Fixes

Solutions to the most frequent issues

Problem	Cause	Fix
python is not recognized	Python is not installed or not added to PATH	Reinstall Python from python.org — check 'Add Python to PATH' during install
No module named 'schedule'	Libraries not installed yet	Run: <code>pip install -r requirements.txt</code>
No module named 'requests'	Same as above	Run: <code>pip install -r requirements.txt</code>
pip is not recognized	pip not in PATH	Try: <code>python -m pip install -r requirements.txt</code>
Dashboard shows no jobs	CMD Window 2 not running, or wrong folder	Make sure <code>python -m http.server 8000</code> is running in Window 2. Open <code>http://localhost:8000/dashboard.html</code> not <code>dashboard.html</code> directly
No desktop notifications	Windows notification permissions	Go to Windows Settings > Notifications > Allow apps to send notifications > find Python and enable it
Rate limited warning in CMD	LinkedIn temporarily blocked the request	Completely normal. The script auto-retries in 15 minutes. Don't reduce <code>CHECK_INTERVAL</code> below 10
Wrong jobs showing up	<code>TITLE_INCLUDE</code> or <code>TITLE_EXCLUDE</code> not set right	Edit <code>.env</code> — add the unwanted keywords to <code>TITLE_EXCLUDE</code> , restart the script
'cd' path not working	Spaces in folder name need quotes	Always use quotes: <code>cd "C:\Users\sidsk\Job Tracker"</code>
.env file not found	File might be named <code>.env.example</code> still	Run: <code>copy .env.example .env</code> — then edit the <code>.env</code> file

You're All Set!

Quick reference card

Everything you need to remember on one page:

Task	Command / Action
Navigate to folder	<code>cd "C:\Users\YourName\Job Tracker"</code>
Install libraries (once only)	<code>pip install -r requirements.txt</code>
Start job notifier (CMD 1)	<code>python job_notifier.py</code>
Start dashboard server (CMD 2)	<code>python -m http.server 8000</code>
Open dashboard in browser	<code>http://localhost:8000/dashboard.html</code>
Change settings	Edit .env file, then restart job_notifier.py
Stop everything	Press Ctrl+C in both CMD windows

✓ TIP

Remember: Two CMD windows must be open at all times — one running job_notifier.py and one running http.server 8000. The browser dashboard at localhost:8000/dashboard.html auto-refreshes every 60 seconds. You get a desktop popup the moment a new job is found. Click Apply on LinkedIn and you're done!

This tool is for personal use only. Use responsibly and in accordance with LinkedIn's Terms of Service. The tool reads publicly visible job listings only — no login or automation of LinkedIn actions is performed.
